USE CASE FLOW

Use Case: Assign Volunteer to Shelter

Main Success Scenario

1. The Disaster Manager navigates to the Relief Volunteer Dispatch module on the central dashboard.
2. The system displays a list of free volunteers alongside a map of shelters.
3. The Disaster Manager selects a specific shelter that requires assistance.
4. The Disaster Manager applies a skill set filter (e.g. "Medical") to the volunteer list. (This triggers the **Filter by Skill Set** use case).
5. The system refreshes the list to display only the available volunteers with the selected skill.
6. The Disaster Manager selects a qualified volunteer from the filtered list and assigns to Shelter.
7. The system **validates the assignment** to ensure the volunteer is still available and the shelter still requires that skill.
8. The system securely updates the backend database, linking the volunteer to the shelter.
9. The system shows **confirmation message** to the Disaster Manager.
10. The Use Case ends successfully.

Alternate Flow

7a. **Volunteer No Longer Available**

- 7a1. During validation, the system detects that the selected volunteer has just been assigned to a different task by another manager, or their status has changed to offline.
- 7a2. The system aborts the assignment and displays an appropriate error message.
- 7a3. The system refreshes the filtered list of available volunteers to reflect real-time data.
- 7a4. The Disaster Manager is prompted to select a different volunteer.
- 7a5. The flow resumes at Step 6.
